

EXAMPLE: (1)

L = Length of the line of the second deck.

d = Distance from amidship portion of second deck to line of second deck.

$$d = \frac{35 \times 3}{100} - \frac{20 \times 1}{100} = + 0.85 \text{ feet.}$$

EXAMPLE: (2)

$$d = \frac{20 \times 3}{100} + \frac{35 \times 1.5}{100} - \frac{18 \times 1}{100} = + 0.945 \text{ feet.}$$
